

Improved Value of the Gasoline and Fuel Oil Co-Product Fractions Generated by the PNNL/LanzaTech Alcohol-to-Jet Process

Proudly Operated by **Battelle** Since 1965

Goal:

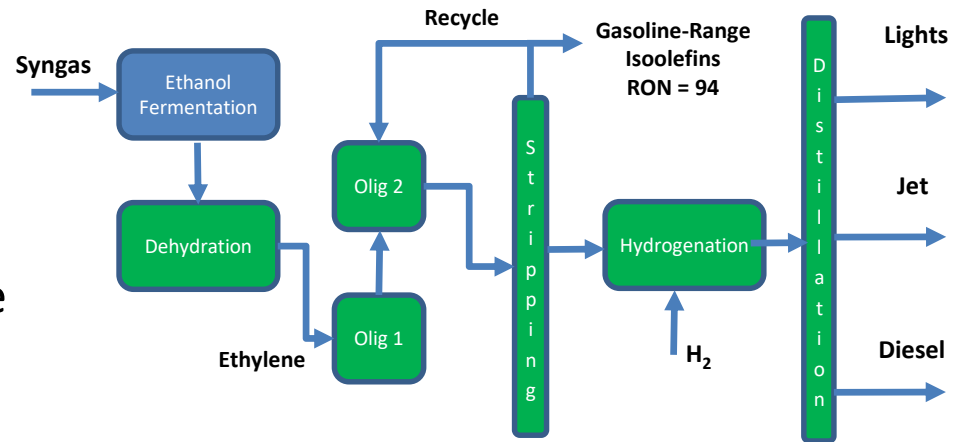

Increase RON of lights to 100 and produce synthetic lubricant base oil from heavies

Approach:

- Skeletal isomerization of Olig 1 product, followed by oligomerization and RON verification
- Fuel oil characterization, hydroisomerization, and evaluation of renewable synthetic lube oil property-structure relationships

Impact on the Bioenergy Industry:

Decrease effective cost of PNNL/LT process jet fuel by >\$1/gal via creation of high value gasoline and synthetic lubricant co-products.

1. Investigate as Group III base oil
2. Hydroisomerization to increase viscosity index

Focus Area 2: Group III Base Oil

ChemCatBio Capabilities Leveraged:

Catalyst preparation, flow reactor testing, hydrocarbon characterization, and techno-economic analysis.
